Real Projects • Real Mentorship • Real Outcomes

- Amazon Homepage Clone created to present my internship experience.
- Developed and published using GitHub Pages.
- Presented by: Dipu Sah | BCA, Guru Kashi University, Punjab

Amazon Homepage Clone

Project presentation | HTML ,CSS

Project Overview

❖ Amazon Homepage Clone

- A front-end website project inspired by the Amazon shopping homepage.
- The page includes a shopping header, search area, account/order/cart links, navigation menu, promotional category sections, and footer.
- Live project: dipusmart.github.io/myfirstwebsite/Amazon.html

Problem Statement

- Build a familiar online-shopping homepage layout for practice.
- Organize shopping categories and promotions clearly.
- Make key navigation areas—search, account, orders, and cart—easy to identify.
- Recreate the look of a large e-commerce website using front-end web technologies.

Business Impact

- Demonstrates how an e-commerce homepage presents many shopping categories.
- Helps users visually locate search, account, orders, and cart areas.
- Provides a practical learning project for students studying web development.
- This is a learning clone, not the official Amazon service.

Requirements

- Functional / visible page elements:
- Header with delivery location and search.
- Account & Lists, Returns & Orders, and Cart labels.
- Navigation links such as Today’s Deals and Gift Cards.
- Promotional sections for home, gaming, fashion, wireless tech, and fitness.
- Footer links and back-to-top option .
- Non-functional: readable layout, consistent styling, and usable page structure.

Solution Architecture

- Browser displays the website from the GitHub Pages URL.
- Front-end page structure presents header, navigation, promotional content, and footer.
- HTML provides page structure; CSS is the likely styling layer for layout and colors.
- The visible page does not establish a backend, database, checkout, or real Amazon account integration.

UI/UX Design

- Top area: delivery location, search box, sign-in/account, orders, and cart.
- Second navigation row: All, Today’s Deals, Customer, Registry, Gift Cards, and Sell.
- Main content: promotional category cards and “See more” links.
- Footer: company information, selling opportunities, payment products, help, and privacy links.

Technology Stack

- Hosting: GitHub Pages
- Front-end: HTML (page structure)
- Styling: CSS (visual layout, if used in the source project)
- Browser: used to view and test the page
- Note: the live page view confirms the page content and hosting URL; it does not independently verify every source file or technology.

Implementation Journey

1. Create the HTML page structure.
2. Build the shopping header and search section.
3. Add navigation links and promotional category sections.
4. Create the footer with grouped links.
5. Publish the page using GitHub Pages.
6. Open the live URL in a browser and review the displayed layout.

Code Walkthrough

- Page sections to explain:
- Header: delivery location, search, account, orders, and cart
- Navigation: shopping and discovery links
- Main content: promotional headings and category areas
- Footer: information, selling, payment, help, and privacy links
- For the presentation, show the actual HTML/CSS source to confirm exact tags, classes, and styling rules.

Testing & Validation

- Open the published URL in a browser and confirm the page loads.
- Review headings, profile details, skills, education, and project descriptions.
- Click navigation and external links to check that they open correctly.
- Check layout and text readability on a mobile screen and a desktop screen.
- Avoid claiming automated tests unless they have actually been run.

Results & Achievements

- Published a working page that can be viewed online.
- Recreated the main visible structure of an Amazon-style shopping homepage.
- Practiced page organization, navigation layout, content grouping, and web hosting.
- Live demo: https://dipusmart.github.io/myfirstwebsite/Amazon.html

Key Learning

- Learned to organize a multi-section web page.
- Understood the role of headers, navigation, content sections, and footers.
- Practiced publishing a front-end project online.
- Next improvements: responsive design, functional search, working product links, and accessibility testing.

Thanks
