ChiPi Technologies | Project Experience Initiative

- A personal portfolio website created to present my skills, education, projects, and internship experience.
- Developed and published using GitHub Pages.
- Presented by: Dipu Sah | BCA, Guru Kashi University, Punjab

My Portfolio Website

Project presentation | HTML , CSS

Real Projects • Real Mentorship • Real Outcomes

ChiPi Technologies | Project Experience Initiative

Student Profile

Name :- Dipu Sah
College Name :- Guru Kashi University, Punjab
Course :- BCA 5th sem
Batch :- 2024-27

Real Projects • Real Mentorship • Real Outcomes

Project Overview

A personal website to show my developer profile

- The website introduces me as a BCA student interested in web development and technology.
- It presents my profile, skills, education, experience, learning journey, and completed projects.
- It also highlights my internship experience and progress as a developer.
- Live website: dipusmart.github.io/myfirstwebsite/MyPortfolio.html

Problem Statement

- A simple resume may not visually demonstrate practical web-development work.
- Students need one place to present their skills, projects, education, and experience.
- Recruiters and mentors need an easy way to understand a candidate's background.
- Goal: create a clear, accessible online profile that can be shared with one link.

Requirements

- Functional: show profile information, skills, education, and internship experience.
- Functional: display project descriptions and learning journey.
- Functional: provide a public website link for visitors.
- Non-functional: readable layout, consistent design, easy navigation, and quick access.
- Non-functional: website should be accessible through a modern web browser.

Solution Architecture

- Visitor opens the published GitHub Pages URL in a browser.
- HTML provides the page structure and content sections.
- CSS styles the layout, typography, colors, spacing, and responsive presentation.
- JavaScript may provide interactive behavior where implemented.
- GitHub Pages hosts and serves the website files.

Technology Stack

- HTML — structures the portfolio content and sections.
- CSS — controls styling, layout, and visual presentation.
- GitHub Pages — publishes the website online.
- Git/GitHub — supports source-code hosting and version control.

Code Walkthrough

- HTML: headings, paragraphs, lists, links, and section containers.
- CSS: typography, colors, spacing, alignment, and page layout.
- Deployment: project files are served through the GitHub Pages URL.
- For a live demonstration, open the site and explain one section at a time.

Testing & Validation

- Open the published URL in a browser and confirm the page loads.
- Review headings, profile details, skills, education, and project descriptions.
- Click navigation and external links to check that they open correctly.
- Check layout and text readability on a mobile screen and a desktop screen.
- Avoid claiming automated tests unless they have actually been run.

Results & Achievements

- A public portfolio website is available through GitHub Pages.
- The website brings profile, skills, education, internship, and project information together.
- The portfolio lists projects including HTML Learning Hub and the portfolio website itself.
- The profile describes frontend development internship experience at ChiPi Technologies.

Key Learning

- Learned to organize a website into clear, meaningful sections.
- Practised presenting technical skills and projects professionally.
- Strengthened understanding of frontend development and website publishing.
- Recognized the value of testing, clean structure, and continuous improvement.
- Thank you — Questions and feedback are welcome.

Thanks
